

ABSTRACT OF THE DISCLOSURE

In a duct connection assemble, whereby upon connecting a saddle flange 2a of the joint duct 8 to the main ribbed duct 3 through the communication hole 1b, the rubber sealant 1 is interposed between the saddle flange 2a and a circumferential area of the communication hole 1b so that protuberances 2b uniformly press the rubber sealant 1 through the recesses 1d to tightly engage the saddle flange 2a against an outer surface of the main ribbed duct 3 through rib-fitting grooves 1a and the water sealing small projective rings 1c. The joint duct 2 is brought into an elastical engagement with the main ribbed duct 3 to achieve a good water sealing action for an extended period of time.
